

This is to inform that the existing water distribution lines of the campus were laid in the year 2000 using 4-inch diameter HDPE pipes. Due to prolonged usage and a substantial increase in student strength increased (150%) in the recent days the systems frequently getting damaged due to over load.

As a result, water leakages are occurring regularly, causing interruptions in water supply and inconvenience to the students and campus residents.

In view of the above, the University proposes to redesign the existing main water distribution system based on the present and projected student strength, ensuring an adequate and reliable water supply across the campus.
